with A. Coster and S. Sazykin

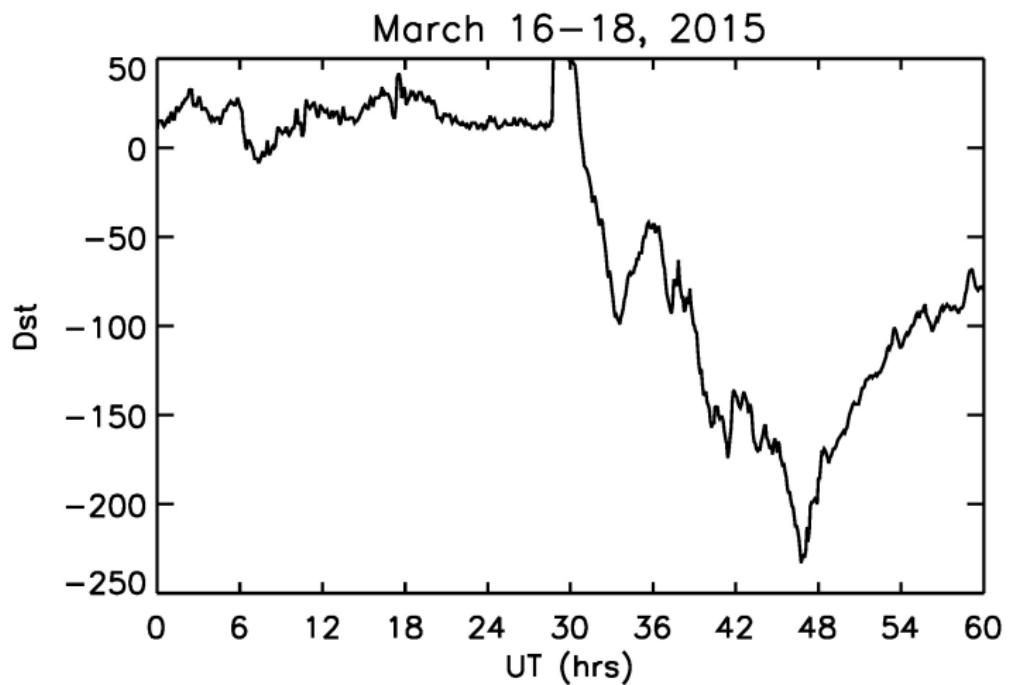

SAMI3/RCM COUPLED MODEL

electrodynamic

$$\nabla \cdot (\underbrace{\sum}_{\text{SAMI3}} + \underbrace{\sum_a}_{\text{RCM}}) \nabla \Phi = S(\underbrace{V_n}_{\text{HWM}}, \underbrace{J_{||}(t)}_{\text{RCM}})$$

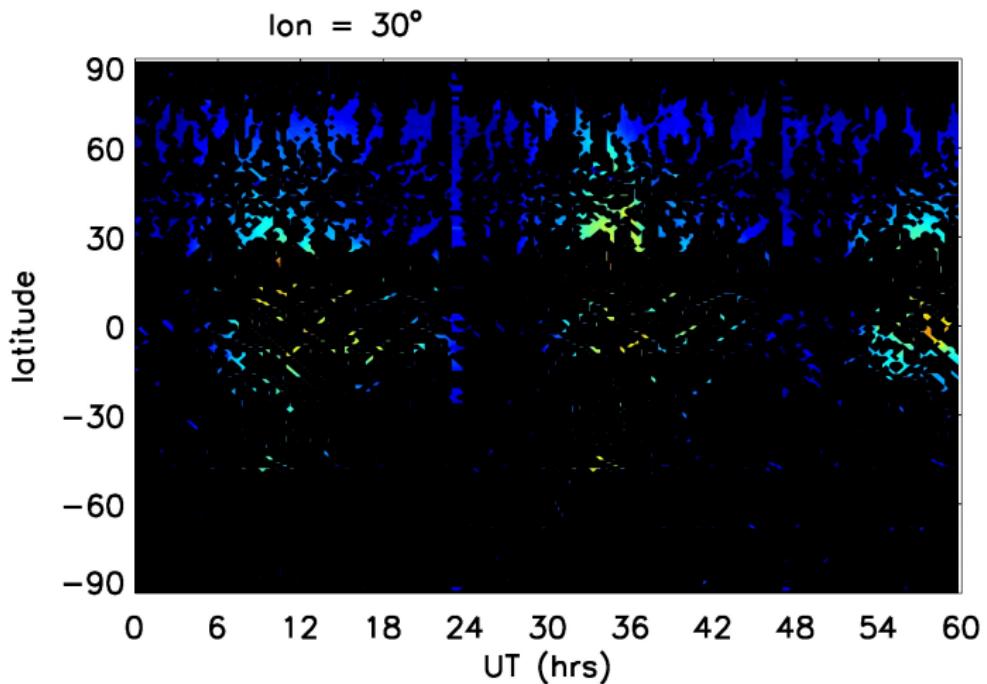

STORMTIME

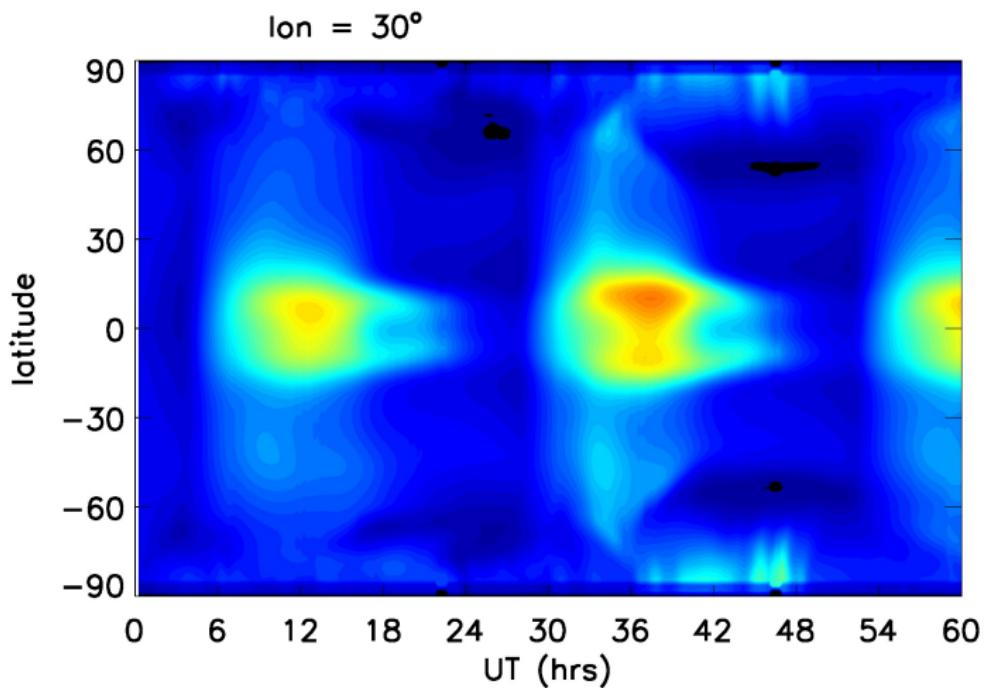

TEC DATA

longitude = 30°

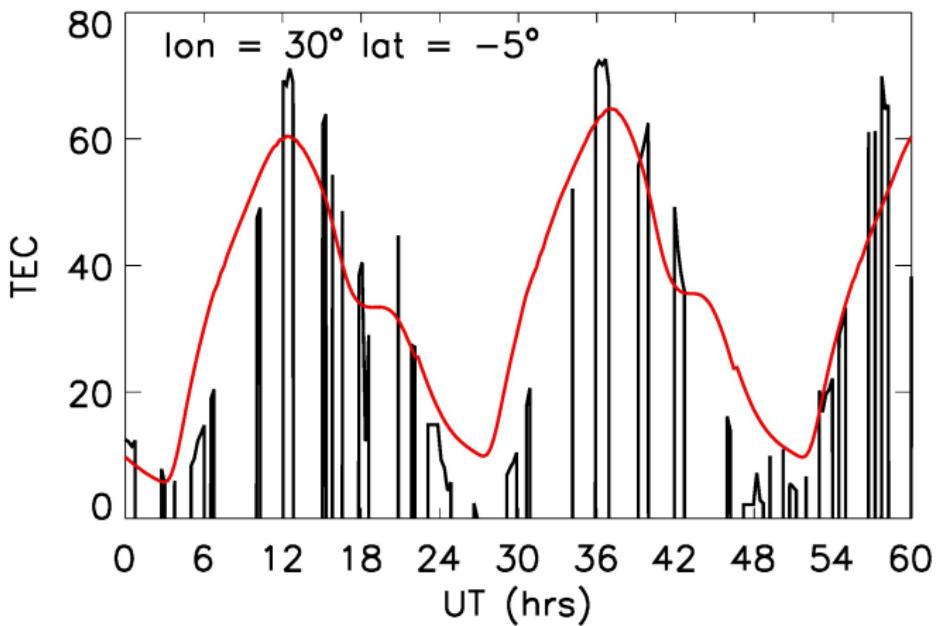

TEC SAMI3/RCM

longitude = 30°

DATA/MODEL COMPARISON

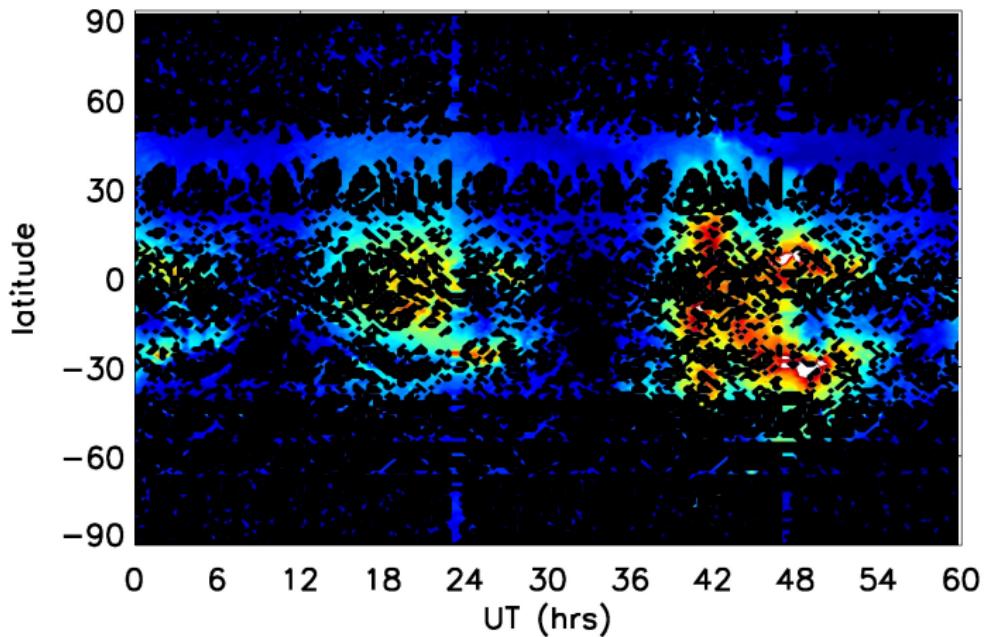

longitude = 30° latitude = -5° (data: black; model: red)

TEC DATA

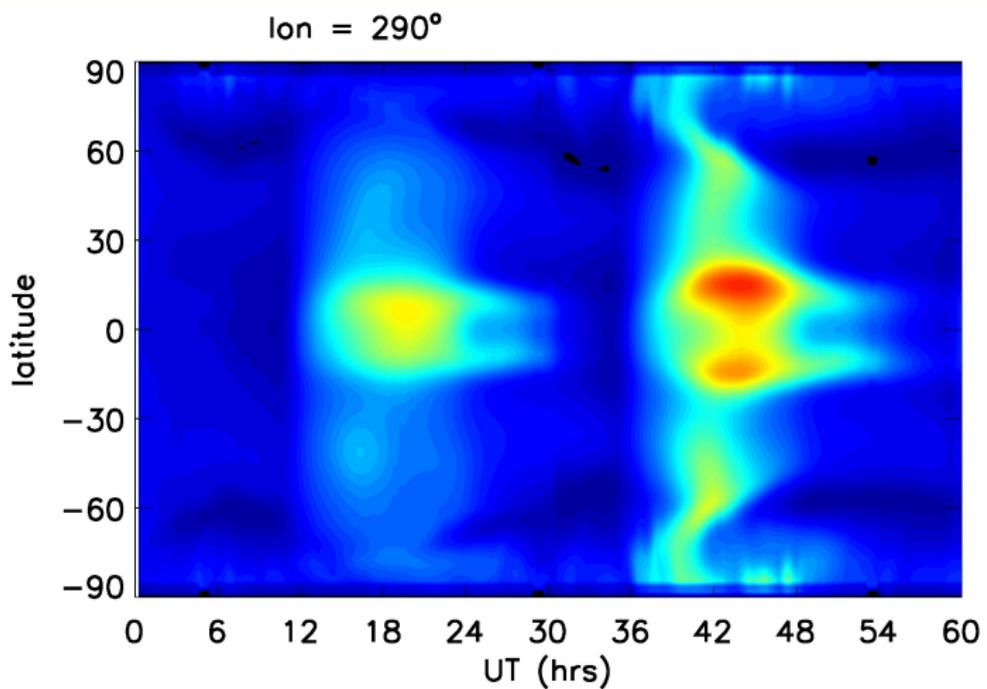

longitude = 290°

lon = 290°

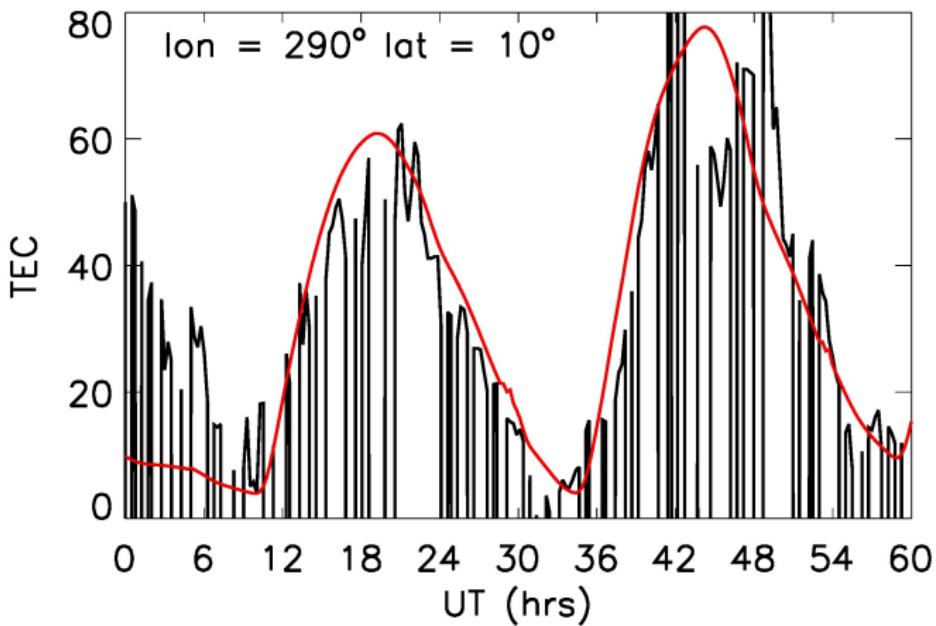

TEC SAMI3/RCM

longitude = 290°

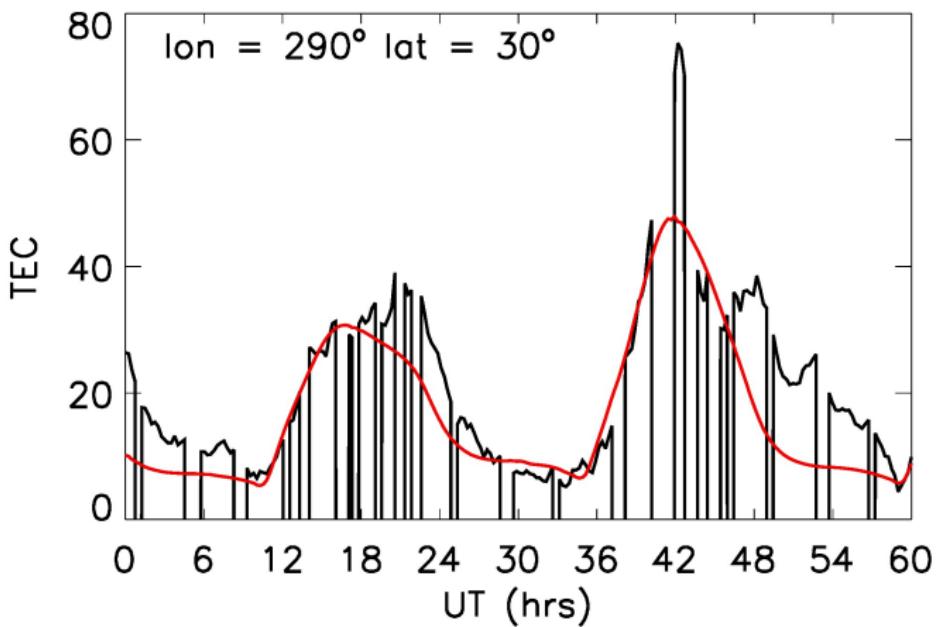

DATA/MODEL COMPARISON

longitude = 290° latitude = 10° (data: black; model: red)

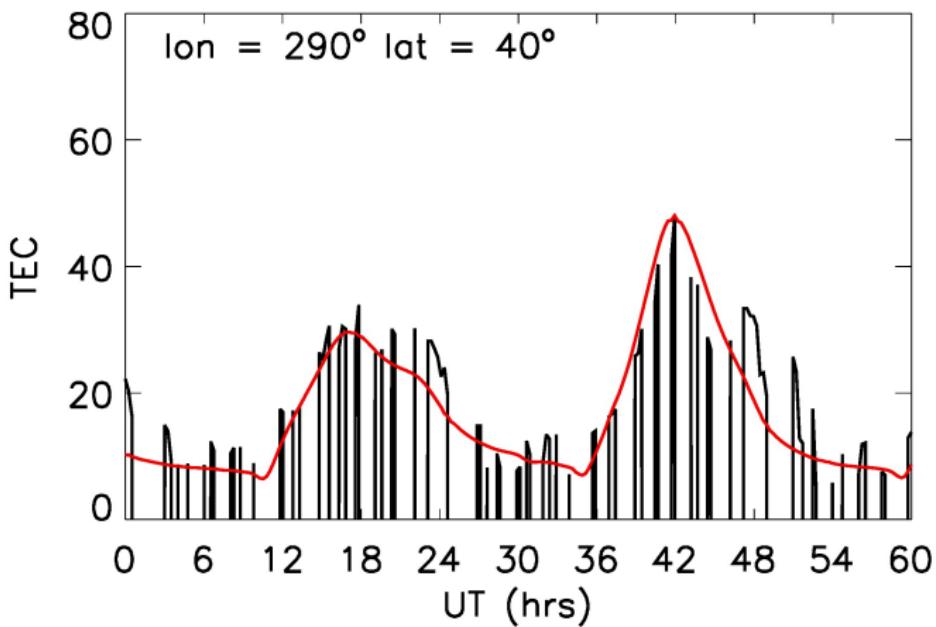

DATA/MODEL COMPARISON

longitude = 290° latitude = 30° (data: black; model: red)

DATA/MODEL COMPARISON

longitude = 290° latitude = 40° (data: black; model: red)

SUMMARY

- SAMI3/RCM used to model March 17, 2015 storm
- quantitative comparison with TEC data
- model results agree reasonably well in the low- to- mid-latitude ionosphere
- both show stormtime enhancement of the electron density in the mid-latitude ionosphere during local daytime / early evening
- caveat: SAMI3/RMC uses untilted, aligned dipole geomagnetic field; despite this results are good (offset model/data by difference in magnetic and geographic equator)
